1290 Retirement Funds

Fund commentary 3Q20

Market overview

Despite a correction in September, U.S. stocks finished the quarter in positive territory after posting strong gains in July and August. Domestic equities primarily benefited from positive signs of an economic recovery and loose monetary policy. Late in the quarter, the Federal Reserve announced it will use an average inflation target in setting rates, allowing for temporary overshoots of inflation.

Overall, stocks performed well globally, but there were differences in regional performances as Asia and the U.S. outperformed the Eurozone and UK. Asian emerging-market stocks posted strong gains, led by Taiwan, India, Korea and China. Japanese shares also posted a gain during the third quarter of 2020 despite the resignation of Shinzo Abe. In contrast, Eurozone and UK equities were flat to negative on fears of rising Covid-19 infections.

Corporate bonds generally outperformed government bonds during the third quarter of 2020 as investors preferred riskier assets. Sovereign debt yields remained low, moving within a narrow range over the course of the quarter. Gold also performed well for the quarter on concerns of rising geopolitical risks, such as the prospect of a contested U.S. presidential election.

Fund overview

The allocations drive performance

Each Fund's performance will reflect the performance of the underlying asset classes and depend upon their percentage weighting within the Fund. Here's why:

The 1290 Retirement Funds are managed to target a specific year of planned retirement. The asset mix will become more conservative each year, until about 10 years after the target retirement year, when it will become relatively stable. The Funds balance the need for appreciation with the need for income as retirement approaches and focus on supporting an income stream over a long-term retirement withdrawal horizon.

To achieve its exposures, the Fund invests in exchange traded funds (ETFs) representing various equity and bond asset classes, so the Funds' performance will be a function of the asset class performance and the percentage weighting of each in the Funds. Current target and actual allocations, as well as performance, are available in an accompanying quarterly fund fact sheet.

Fund highlights

What helped performance during the quarter?

- In general, being overweight equities was the top contributor to performance as equity markets bounced back from their lows in March (with the exception of the 1290 Retirement 2040 and 1290 Retirement 2045 Funds).
- Having active weight exposure to TIPS contributed to performance.

What hurt performance during the quarter?

- Security selection within equities was the top detractor from performance as having a low volatility tilt was not beneficial across regions and market capitalizations. Domestic small-cap and mid-cap equities had over 3.5% in performance differential between low volatility and market capitalizations for the three-month period.
- Within Fixed Income, having no exposure to high yield (with the exception of the 1290 Retirement 2020 and 1290 Retirement 2025 Funds) detracted from performance as it was the best performing asset category within the asset class, up 4.0%.

The 1290 Retirement Funds seek the highest total return over time consistent with their asset mix while managing portfolio volatility. Total return includes capital growth and income. Performance may be affected by one or more of the following risks. Investments in foreign securities, including depositary receipts, involve risks in addition to those associated with investing in U.S. securities. Foreign markets, particularly emerging markets, may be less liquid, more volatile and subject to less government supervision than U.S. markets, and it may take more time to clear and settle trades involving foreign securities, which could negatively impact the Fund's investments and cause it to lose money. Security values also may be negatively affected by changes in the exchange rates between the U.S. dollar and foreign currencies. Differences between U.S. and foreign legal, political and economic systems, regulatory regimes and market practices, as well as trade barriers and other protectionist trade policies (including those of the U.S.) governmental instability, or other political or economic actions, also may adversely impact security value. Equity securities involve the risk that the value of the stocks and other equity securities may fluctuate, and sometimes widely fluctuate, in response to changes in a company's financial condition as well as general market, economic and political conditions and other factors. Fixed income investments are subject to credit risk and interest rate risk. The fund is subject to the risk that the issuer or guarantor of a fixed income security, or the counterparty to the transaction, is unable or unwilling, or is perceived as unable or unwilling, to make timely interest or principal payments, or otherwise honor its obligations, which may cause the Fund's holding to lose value. In addition, changes in interest rates may affect the yield, liquidity and value of investments in income producing or debt securities. When interest rates rise, the value of the Fund's debt securities generally decline. Conversely, when interest rates decline the value of the Fund's debt securities generally rises. The Fund will be subject to the risks associated with the securities and other investments in which the Underlying ETFs and the ability of the Fund to meet its investment objective will directly depend on the ability of the Underlying ETFs to meet their investment objectives. An index-based ETF's performance may not match that of the index it seeks to track. An actively managed ETF's performance will reflect its adviser's ability to make investment decisions that are suited to achieving the ETF's investment objective. In addition, the use of volatility management techniques may limit Underlying ETFs, and in turn, the Fund's participation in market gains, particularly during periods when market values are increasing, but market volatility is high. Diversification does not eliminate the risk of experiencing investment losses. The underlying ETFs may be unsuccessful in maintaining a portfolio of investments that minimize volatility.

An investment in the fund will not ensure that an investor will have assets sufficient to cover retirement expenses or that an investor will have enough saved to be able to retire in, or within a few years of, the target year identified in the Fund's name.

Past performance is no guarantee of future performance.
